

Electric Vehicle Charge and Range Analysis

By: Nammi Manasa

Project Overview:

The **Electric Vehicle Charge & Range Analysis** project analyzes electric vehicle datasets to provide meaningful insights into EV performance, charging infrastructure, pricing, driving range, energy efficiency, and brand comparisons. Interactive dashboards and Tableau Stories enable users to explore data through filters, charts, maps, and KPIs. The application helps EV buyers, researchers, manufacturers, and policymakers make informed decisions by presenting complex data in a simple, visual, and user-friendly manner.

Dashboard Overview:

The **Electric Vehicle Charge & Range Analysis Dashboard** provides interactive visualizations to analyze electric vehicle performance, charging infrastructure, pricing, efficiency, and brand comparisons. Users can apply filters to explore insights and support better decision-making.

Dashboard 1:

Dashboard 2:

KPI's:

These KPIs provide a quick summary of the electric vehicle market by highlighting the number of EV models, their average driving range, average price, and energy efficiency. They serve as the starting point for users to explore the detailed insights available in the interactive dashboard.

Story Overview

The **Tableau Story** presents the analysis in a sequential manner by highlighting key insights on charging stations, EV range, pricing, efficiency, and brand performance. It helps users understand the findings through interactive story points.
